

**Description**

Syndromic surveillance is public health surveillance that emphasizes the use of near "real-time" health data and statistical tools for disease or hazardous event detection, situation awareness for mass gatherings and public health emergencies, and ad hoc and population health trend analyses. For syndromic surveillance purposes, required data on all clinical encounters must be sent to the jurisdictional public health agency within 12 hours of any given encounter, and in accordance with local or state laws and practices.

The Ambulatory Visit – PCP New Diagnosis Test Case provides an example of an encounter that takes place in the ambulatory setting. This test case also provides an example where the facility sending the syndromic surveillance message is different than the facility where the patient received care. This Test Case will test using ICD-10 Dx codes and pseudonymized patient name. In this test case, a pediatric patient is seen by his Pediatrician for a rash with a high fever, cough, and watery eyes. The family has recently returned from travel to an amusement park. The pediatrician suspects measles and orders a Real-time RT-PCR to confirm, and provides instruction for home isolation to prevent potential spread. Results received post-discharge are positive for measles, and the patient record is updated with the final diagnosis. Syndromic surveillance data about the visit are transmitted to the local health department.

This test case involves 3 steps:

- a registration message (ADT^A04),
- followed by a discharge message (ADT^A03),
- followed by an update message (ADT^A08)

Messages in this test case will be used in a Manual Test Step under functional requirement testing for validating the HIT capability of populating Visit ID (PV1-19.1) and Visit Time (PV1-44.1) each with the same value for all messages included in this Test Case.

**Test Objectives**

This test case examines a Health IT Module's ability to create an ADT^A04-Registration message, an ADT^A08-Update message, and an ADT^A03-Discharge message within HL7 Version 2.5.1 Implementation Guide: Syndromic Surveillance, Release 1 - US Realm Standard for Trial Use July 2019, conformance requirements.

The following test objectives and variants are supported by this test case:

- Setting is Ambulatory.
- Chief complaint is captured as narrative in PV2-3 Admit Reason
- **Patient name is de-identified in the submissions:** Per ASTP/ONC, for certification testing HIT developers must demonstrate that their system supports the Patient Name and de-identified data in PID-5 (this policy is conformant to the named standard HL7 Version 2.5.1 Implementation Guide: Syndromic Surveillance, Release 1 - US Realm Standard for Trial Use July 2019). The patient name presented in a de-identified manner is required for this Test Step.
- **Diagnoses are submitted test using either ICD-10-CM or SNOMED-CT:** Per ASTP/ONC, for certification testing a Health IT Module can use either the ICD-10-CM or SNOMED CT® value sets in the submitted messages for all of the test steps in the Syndromic Surveillance Test Suite. Where the tool does not have test data that supports the Health IT Module's value set (either ICD-10-CM or SNOMED CT®), the developer of the Health IT Module must provide the codes and testers must perform a visual inspection of the messages for these test steps to ensure that equivalent and valid ICD-10-CM or SNOMED CT® are used to populate the messages. This policy is conformant to the named standard HL7 Version 2.5.1 Implementation Guide: Syndromic Surveillance, Release 1 - US Realm Standard for Trial Use July 2019). ICD-10-CM codes are provided/required in the Test Data for coding the diagnoses in this Test Case.
- Pediatric case where age is measured in months.
- Update Diagnosis Post-Discharge
- Multiple Races
- Insurance unknown
