

Description

The HIT Developer provides a description of the approach taken to configure the system under test with the ability to transmit syndromic surveillance messages within 12 hours as required by the HL7 Version 2.5.1 Implementation Guide: Syndromic Surveillance, Release 1 - US Realm (Jul 2019). The HIT Developer provides evidence of such configuration capability. Evidence may be in the form of e.g. configuration files, installation option screens, installation documentation, etc.

The Tester manually reviews the test evidence provided to evaluate whether the HIT Module has the capability to conform to this IG-specified business requirement.

Comments

Evidence may be in the form of e.g. configuration files, installation option screens, installation documentation, etc.

Pre-condition

A04-Registration, A08-Update, and A03-Disposition messages are generated by the HIT Module.

Post-Condition

No Post-Condition

Test Objectives

This Manual Test Step enables the Tester to manually evaluate the capability of the HIT Module to submit syndromic surveillance messages within 12 hours of the message trigger event as per the HL7 Version 2.5.1 Implementation Guide: Syndromic Surveillance, Release 1 - US Realm (Jul 2019) conformance requirements.

Evaluation Criteria

The tester visually inspects the test evidence provided and description of how the HIT Module can be configured to transmit syndromic surveillance messages within 12 hours of the message trigger event as per the HL7 Version 2.5.1 Implementation Guide: Syndromic Surveillance, Release 1 - US Realm (Jul 2019) conformance requirements.
